## Introduction

This is a human speakable programming language, geared for artificial general intelligence development.

#### 1.1 Problem

#### 1.1.1 Disglossia

#### Computer Languages

In order to program all levels of a modern computer, you need to know many different programming languages. Assembly/LLVM/SPIRV at the lowest level, C for system programming, C++/GTK/QT for graphical interface programming, Javascript/HTML/CSS/PHP/Perl for web programming, OpenCL/OpenMP/Ptl for parallel programming, bash/python/ruby/node for scripting, Java/C#/Lua for portable programming, ansible/chef/docker/kubernetes for administration, a host of different data storage formats XML/CSV/JSON/YAML/SQL and different documentation languages LaTeX/Doxygen/Markdown/TexInfo just to name a few. That doesn't even include statistics, audio, image and video processing languages.

Human Languages

#### 1.2 Paradigm

#### 1.2.1 Obsolete Non-Parallel Paradigms

Object Oriented, non-tail recursion, globals.

It's easy to write bad code in many paradigms.

#### 1.3 Inspiration

I was mentally projecting myself into a robot host body one day and realized that it would take a superhuman Artificial intelligence to be proficient in all of the languages and protocols of a modern computer and their interactions.

And I came to the realization that I wanted to be able to have access to all my knowledge and abilities with one language.

# Part I Core Language

# Phonology

There are two scripts for the SPEL core-language, one based on URL-compatible ASCII and one based on IPA. If you are unsure of how to pronounce a letter, then simply copy paste the IPA letter into wikipedia which will give ample explanation.

Phonemes are based on the most popular distinctive ones on phoibles http://phoible.org/parameters plus two clicks.

See table 2 for the ASCII, IPA and their description.

#### 2.1 Notes

Alignment the `h' or /h' is a semi silent h /h/, and is used mostly for alignment purposes. All words when written in text are either 2 or 4 glyphs long. However some root and grammar words are three letters, thus they need alignment. For 3 letter roots of the form CVC (consonant vowel consonant) the h prefixes the word, turing it into hCVC, for 3 letter grammar words of the form CCV, the h is suffixes it, turning it into CCVh. A simple way to remeber this is that all words must comply with the CCVC or CV form. So if a three letter word is missing one of those C's then replace it with an `h' to get proper alignment.

Glottal stops glottal stop `.' is only used for foreign quotes, such as that of proper names, as they don't necessarily conform to alignment rules

Tones Tones `7' and `\_', are mostly for low frequency words

Clicks Clicks `1' or `8' are used for temporary words and variables, especially useful to make short forms of compound words which are often used in a text or flock of people. Other options for short-forms are acronyms which must comply with the phonotactic rules of the language and be grammatically marked as acronyms, and initialisms, which are foreign quotes as they don't fit the phonotactic rules.

#### 2.2 Contribution

Currently the phonology is pretty much finished, however if there are some compelling arguments then it may still be modified.

```
ASCII
        IPA
               Description
                                                        English

               lateral click
                                                        winking \underline{\text{click}}
```

## Grammar

#### 3.1 Composition

those marked with asterisk are mandatory for phrase formation.

Phonology

Grammar Words are of the form CV or CCVH where C is consonant, H is /h/ and V is vowel.

Root Words are of the form HCVC or CCVC where C is consonant, H is /h/ and V is vowel.

sentence emotions evidentials mood\*

noun phrase (root or pro-form)\* suffix case\*

verb phrase (root xor copula)\* (aspect or tense)\*

adjective phrase (root or pro-form)\* suffix adjective-marker\* case
 case needs to be marked if adjective comes after the head noun, or could be confused
 as part of a different noun phrase.

adverbial phrase (root or pro-form)\* suffix adverb-marker\*

#### 3.2 Grammar Tree

#### 3.3 Noun Classes

abstract-gender for thoughts and ideas

animate-gender for more active things,
 animacy intensifier

anthropic-gender for anatomically human-like
 things

augmentative greater in size or intensity

collective-noun noun taken as a collection
 of things, turns mountain into
 moutain range, or trees into forest,
 or shrub into shrubland

common-gender male or female gender,
 hermaphrodites and ambigious gender,
 such as bigender, trigender, pangender,etc

diminutive less in size or intensity

dual-number two of the noun

inanimate-gender for less active things,
 animacy lowerer

feminine-gender female gender

masculine-gender male gender

#### • noun

#### - pro-form

- \* person-deixis
- \* time-deixis
- \* space-deixis
- \* interior-deixis
- \* surface-deixis

- relativizer
- interjection

Table 3.1: Grammar Tree

- mineral-gender natural forces, rocks,
   bodies of water, etc
- neuter-gender non-reproductive entities,
   including asexual
- paucal-number small amount of something, 8 bit value (0-255)
- number moderate amount of something,
   16 bit value between 256 and 65
   thousand.
- plural-number large amount of something, 32bit value, between 65 thousand and 4 billion.
- multal-number giant amount of something,
   64bit value, between 4 billion and
   18 quintillion.
- rational-gender for entities that have self-selected goal-oriented communication, such as humans, spiritual entities, aliens and machine intelligence
- singular-number one of the noun
- trial-number a few or three of the noun
- vegetal-gender for plants, including
   power plants, solar panels, turbines,
   simple and complex machines, including
   primarily remote controlled ones
- zoic-gender for animals, including basic
   robots, with some intelligence,
   semi-autonomous vacuum cleaners,
   aerial-vehicles. Capable of basic
   decisions but primarily rellying on
   instinct.
- artistic-gender for arts, like martial
   arts, visual arts, calligraphy,
   architecture, generally pertaining
   to activities which are physical
   manipulations in specific manners
- research-gender for fields of study,
   such as mathematics, physics, biology,
   and other -ologies, generally pertaining
   to exploration and acquisition of
   knowledge.
- vehicle-gender for vehicles, typically
   those that are primarily for the
   purpose of transportiation. Includes
   space-ships and small asteroids/comets.

- locality-gender for places, including homes, areas, lakes, and countries.

  Includes large asteroids, and common locations of a corporation, for-example school.
- planetary-gender For planemo, or planetary-mass
   objects which are rounded by their
   own gravity, and major locations
   of a corportion, for-example local
   school board.
- star-gender For stars and central locations
   of a corporation, for-example provincial
   school board.
- galaxy-gender For galaxies and major
   divisions of a corporation or virtual
   world, for-example department of
   education.
- universe-gender For universes, corporations
   and virtual worlds, for example a
   government.

#### 3.3.1 grammatical number

- 1. singular
- 2. dual-number
- 3. trial-number
- 4. paucal-number
- 5. plural-number

# 3.3.2 noun classes for relative adjustment

- diminutive
- augmentative
- inanimate-gender
- $\bullet \ \, \text{animate-gender} \\$

#### 3.3.3 noun classes by animacy

this is based on a thirteen chakra system with animist world view.

- 0. abstract-gender
- 1. mineral-gender
- 2. vegetal-gender
- 3. zoic-gender
- 4. rational-gender
- 5. artistic-gender
- 6. research-gender
- 7. vehicle-gender
- 8. locality-gender

#### 3.4 Tense

past-tense things that happened

hesternal-tense yesterday

recent-past-tense

remote-past-tense

present-tense now, things that are happening

hodiernal-tense today

future-tense things that will happen

crastinal-tense tommorrow

soon-future-tense

remote-future-tense

## 3.5 Aspects

#### atelic-aspect a

cumulative-reference process for SPEL it is like signal processing, at any point it is still processing, perhaps for parallel processes

cessative-aspect for ending process
 for SPEL exiting process
 for hardware description language
 falling edge

- 9. planetary-gender
- 10. star-gender
- 11. galaxy-gender
- 12. universe-gender

# 3.3.4 noun classes regarding reproductive attributes

- neuter-gender
- male-gender
- female-gender
- common-gender
- anthropic-gender

completive-aspect completely and thoroughly
 finished
 for SPEL finished with no errors

continuative-aspect process started but
 not active
 for SPEL idle processes

delimitative-aspect temporary process

frequentive-aspect repetitive process
 for SPEL can be used for servers/daemons

- gnomic-aspect general truths
   for SPEL defining functions
- habitual-aspect habitual process
  for SPEL can be provided services or
  features
- inchoative-aspect begining of process
   for SPEL loading process
   for Hardware Description Layer
   signal rising edge
- imperfective-aspect for SPEL a process
   which is ongoing
   any partial process
- momentane-aspect for things that happen
   suddenly or momentarily, like power
   surges and lightning bolts. For
   instance a clock-tick could be
   momentane and frequentive.

#### 3.6 Grammatical Mood

- admonitive-mood warning, I warn you that for SPEL error messages
- affirmative-mood agreeingly, I agree that for SPEL selection of correct output, as per reinforcement learning or genetic algorithms
- apprehensive-mood fearfully, I fear that
   for SPEL throwing exceptions
- assumptive-mood assumingly, I assume that for SPEL assert statements
- conditional-mood if such and such
   for SPEL conditional clauses
- commissive-mood I commit to, I promise
   that
   for SPEL setting calendar events,
   and personal virtue goals, also for
   unit-tests
   for Parliment, to send motion to
   comittee
- benedictive mood blessings, I wish the blessing that for SPEL increasing priority of a process

- perfective-aspect any whole process
   for SPEL a process which has completed
- progressive-aspect for active process
   for SPEL for active processes
- prospective-aspect for processes that
   happen after
   for SPEL queued processes
- retrospective-aspect for processes that
   happen before
   for SPEL prerequisite processes
- telic-aspect quantized process

  for processes where any of the
  parts are not the whole, only taken
  together is it the whole.

  for SPEL this is processes that
  require sequential components of a
  different kind.
- deductive-mood deductively, I deduce
   that
   to mark conclusions through deductive
   inference
- deliberative-mood shall I?, do you think
   that?
   for SPEL asking user input
- deonitic-mood I should, I ought to, I
   plan that
   for SPEL pseudo-code
- delayed imperative in future do that for SPEL, scheduled jobs
- desiderative-mood I want to, I desire
   that
   for SPEL near term goal setting
- inductive-mood inductively, I derive
   that
   to mark conclusions through inductive
   inference
- $\begin{array}{c} \textbf{inferential-mood} \ \ \textbf{for things} \ \ \textbf{which are} \\ \textbf{infered based on premises}. \end{array}$
- epistemic-mood perhaps, I consider it
   possible that

#### Table 3.2: Aspect Tree

#### • state

- perfective-aspect
  - \* momentane-aspect
  - \* completive-aspect
- imperfective-aspect
  - \* continuous-aspect
  - \* progressive-aspect
  - \* delimitative-aspect

#### • occurence

- gnomic-aspect
- habitual-aspect
- part of time
  - inchoative-aspect
  - cessative-aspect
- relative time
  - retrospective-aspect
  - prospective-aspect

#### <h3>Lexical</h3>

- composition
  - atelic
  - telic
  - stative-verb
- causal
  - autocausative-verb
  - anticausative-verb

- eventive-mood in the event that
   for SPEL event catchers
- gnomic-mood generally, In general I
   believe that
   for SPEL function declaration
- hortative should, I urge that
- imperative-mood you must, I command that
   for SPEL, imperative programming
   sentence
- imprecative mood curse, curse that
   for SPEL decreasing priority of
   a process, also for setting up
   security measures, such as firewalls,
   honey pots and others
- indicative-mood indicating the real, I
   indicate that
   for SPEL variable declaration
- interoggative-mood questioningly, I
   question that
   for SPEL search queries
- irrealis-mood unreal sentence, it isn't
   real that
   for SPEL comments
- jussive-mood tell them to, I command
   them that.
   for SPEL issuing commands to remote
   location
- necessitative-mood I need that
   for SPEL listing of required libraries
- optative-mood I wish that
   for SPEL long term goal setting

- potential-mood possibly, I consider it
   possible that
   for SPEL try statements
- permissive-mood I permit that
   for SPEL setting and limiting priviliges,
   also for SPARK style contracts
   for Parliament set limits of debate
- precative-mood I request that
   for SPEL making network requests and
   pull requests
   for Parliment amendments
- prohibitive-mood don't, I forbid that
   for SPEL, blocking certain things,
   or ignoring certain inputs
- propositive-mood I suggest that, I propose
   that
   for Parliment as a main motion
   starter in deliberative discussion
- realis-mood It is real that
- sensory-evidential-mood evidence I've
   experienced tells me that
   for Parliament or Court, to bring
   evidence before the assembly, also
   to mark premises in logical arguments.
- subjunctive-mood unreal clause
- speculative-mood speculatively, I guess
  that
- volitive-mood desires, wishes or fears
- hypothetical-mood For things which aren't necessarily true, but could easily be true, from the speakers perspective. also for spel catch statements

Table 3.3: Grammatical Mood Tree

- realis
  - indicative
  - evidential
  - energetic
- irrealis-mood
  - deontic
    - \* commissive
      - · permissive
      - $\cdot$  prohibitive
    - \* directive
      - · imperative
      - · hortative

### 4.3 Trochaic Rhythm

First syllable strongest, emphasis on odd syllables, grammar words always unemphasized.  $\verb|http://wals.info/chapter/17|$ 

# 4.4 Espeak

Espeak unfortunately does not have trochaic rhythm support at this time (Feb 2017)

Part II

Compiler

# Specification

SPAL simple compile to OpenCL.

#### 5.1 stages of compilation

- 1. natural language text (perhaps)
- 2. analytic language text
- 3. SPAL language text
- 4. SPAL encoded tiles
- 5. (OpenCL) C with SPAL names
- 6. (OpenCL) C with natural names (perhaps)

#### 5.2 Method for implementation

In theory can use any language for implementation. Though ideally would be a version of C which is similar to the above, so it could then be recoded in SPAL.

#### 5.3 answer verification

The agree debug library is OpenCL and holy ceremeny (pure function) compatible.

Ideally would have a way of listing many inputs and their corresponding outputs. If this could be fed to an OpenCL kernel that would be delicious.

The agree debug library can be the ``testing framework'' for SPAL programs. So each agree statement adds a line to the newspaper, after the program is complete it can list the statements in the newspaper, saying those are the tests that failed. Additionally could have a list of the number that have passed.

I'm thinking can save both the line number, and the amount that have passed in the first line of the newspaper. It can be an actual sentence, with two 16bit spaces for the values. gzat na hnuc do lweh hnuc do mwah slak fa li

A newspaper until number with number succeeded.

A newspaper should be at least 16 sentences long, which is one page or 512 bytes, and less than or equal to 512 sentences, (32 pages), since that is the most that could fit in L1 memory with other processes.

Pyash	SPAL	၂ င	file	
kratta krathnimna li	cardinal _top cardinal name _nom _rea   int main () {	int main () {	cardinal_name.c

htipdoyu txikka hciccu hyikdoyu plosliwa htekhromli	1 ten _num _ins indexFinger _acc down _con indexFinger _acc khromli one _num _ins plus _rea _and library program _rea	c down _con indexFinger_ library program _rea		<pre>for {;i &lt; 0xA; ++i}{ library_program ();}</pre>

#### 5.4 Memory

There is no dynamic allocation of memory, only static, until further notice.

This is because historically dynamic allocation of memory has led to many memory leaks and other problems.

#### 5.5 Control Flow

Instead of the traditional for loop that relies on variables defined outside it's bounds, the for loops in SPAL only contain a function, and a listener to see if it should break early. That way based on the size of the for loop, the compiler can assign it to run on single thread, multi thread CPU, or GPU.

#### 5.6 translate all independentClauses to C

Any independent-clause can be turned into C. can be of the form:

sort1\_case1\_sort2\_case2\_verb\_mood (sort1 name, sort2 name);

#### 5.6.1 C Name Composition

For C, will need to include the types of the names in order to properly call functions, otherwise would have to have extra searching to locate which function is being refered to.

This will make it a bit like Navajo or Swahili, where the noun class will be mandatory. So we should have easy grammar words for them,

for names of things:

for names of things:

plu paucal-number 8bit

do number 16bit

pu plural-number 32bit

ml6h multal-number 64bit

ml6hhsosve multal-number sixteen vector, vector of 16 64bit values.

fe referrential, pointer

crih letter, char

crihfe letter referrential, char \*

It seems I would only need a hash table lookup for operating on the GPU, seems like most of the other stuff can be done with a few conditionals.

# Operation Template

#### 6.1 overview

#### 6.1.1 translation

An English programmer writes English text.

An English encoder encodes the English text to the Pyash medium code.

- A Chinese translator decodes the Pyash medium code into Chinese text.
- A Chinese programmer writes Chinese text.
- A Chinese encoder encodes the Chinese text into the Pyash medium code.

#### 6.1.2 Compiler

A code compiler from the medium code, to a cardinal ``.c'' file, library header file, and library ``.c'' files, as well as a kernel ``.cl'' file, and library file of intermediate code

Clang compiler takes main and library ``.c'' files, and library header files, and produces an byin binary.

The byin binary operator sets up the constant stack, input data and makes writeable output data.

The host code starts the virtual machine kernel, and library kernels.

# Pyash Encoding

The virtual machine uses variable-length-instruction-word (VLIW), loosely inspired by head and tails instruction format (HTF). HTF uses VLIW's which are 128 or 256 bits long, however there can be multiple instructions per major instruction word.

#### 7.1 VLIW's Head Index

The head is really a parse index, to show the phrase boundaries. In TroshLyash each bit represents a word, each of which is 16bits, when a phrase boundary is met then the bits flip from 1 to 0 or vice-versa at the phrase boundary word. index takes up the first 16bits of the VLIW. This would lead to 256bit (32Byte) VLIW's. The real advantage of the indexing occurs when there either multiple sentences per VLIW, or when there are complex sentences in the VLIW's. Having the VLIW's broken up into 32Byte chunks, makes it easier to address function entry points, which can be placed at the beginning of a VLIW. Can fit 16 VLIWS in a POSIX page, 128 VLIW's in a Linux page, so would only need 1 byte (8bits) for addressing functions that are within 1 page distance.

#### 7.2 Word Compression

Now for the slightly more interesting issue of packing as many as 5 glyphs into a mere 16 bits. Why this is particularly interesting is that there is an alphabet of 32 glyphs, which would typically required 5 bits each, and thus 25bits in total. However the 16 bit compression is mostly possible due to the rather strict phonotactics of TroshLyash, as only certain classes of letters can occur in any exact place. The encoding supports 4 kinds of words, 2 grammar word classes and 2 root word classes. Where C is a consonant, T is a tone and V is a vowel, they are CVT, CCVT, and CVTC, CCVTC respectively.

#### 7.2.1 CCVTC or CSVTF

I'll start with explaining the simplest case of the CCVTC word pattern. To make it easier to understand the word classes can call is the CSVTF pattern, where S stands for Second consonant, and F stands for Final Consonant. The first C represents 22 consonants, so there needs to be at least 5 bits to represent them. Here are the various classes

```
``C'':``p'',``t'',``k'',``f'', ``s'',``c'',``x'', ``b'',``d'',``g'',``v'', ``z'',``j'', ``n'',``m'',``q'',``r'', ``l'',``y'',``w'',
```

""S'' "`f'', "`s'', "`c'', "`y'', "`r'', "`w'', "`l'', "x'', "`z'', "`j'', "`v'',

```
``V'' ``i'',``a'',``e'',``o'',``u'',``6'',
``T'' ``7'',``_'',
``F'' ``p'',``t'',``k'',``f'', ``s'',``c'',``n'',``m''
```

, (can check the phonology page for pronunciation) C needs 5 bits, S would need 4 bits, however the phonotactics means that if the initial C is voiced, then the S must be voiced, thus ``c'' would turn into ``j'', ``s'' into ``z'' and ``f'' into ``v'', also none of the ambigiously voiced phonemes (1, m, n, q, y, w, r) can come before a fricative because they have a higher sonority, thus must be closer to the vowel. So S only needs 3 bits. V needs 3 bits T needs 2 bits and F needs 3 bits which is a total of 16 bits. 5+3+3+2+3=16 However there are other kinds of words also. we'll see how those work.

#### 7.2.2 HCVTF

So here we have to realize that CVC or CVTC is actually HCVTF due to alignment. So what we do is make a three bit trigger from the first word, the trigger is 0, which can be three binary 0's, 0b000 3+5+3+2+3 = 16 H+C+V+T+C this does mean that now 0b1000, 0b10000 and 0b11000 is no longer useable consonant representation, however since there are only 22 consonants, and only 2 of those are purely for syntax so aren't necessary, so that's okay, simply can skip the assignment of 8, 16 and 24.

#### 7.2.3 CSVT

This is similar to the above, except we use 0b111 as the trigger, meaning have to also skip assignment of 15, 23 and 31. 3+5+3+3+2=16?+C+S+V+T

#### 7.2.4 CVT

For this one can actually simply have a special number, such as 30, which indicates that the word represents a 2 letter word. 5+5+3+2+1 F+C+V+T+P what is PF P can be a parity-bit for the phrase, or simply unassigned.

#### 7.3 Quotes

Now with VM encodings, it is also necessary to make reference to binary numbers and things like that. The nice thing with this encoding is that we can represent several different things. Currently with the above words, we have 1 number undefined in the initial 5 bits. 29 can be an initial dot or the final one, can call the the quote-denote (QD), depending on if parser works forwards or backwards. Though for consistency it is best that it is kept as a suffix (final one), as most other things are suffixes. 5+3+8 = 16 Q+L+B QD has a 3 bit argument of Length. The Length is the number of 16bit fields which are quoted, if the length is 0, then the B is used as a raw byte of binary. Otherwise the B represents the encoding of the quoted bytes, mostly so that it is easier to display when debugging. The type information is external to the quotes themselves, being expressed via the available TroshLyash words. So in theory it would be possible to have a number that is encoded in UTF-8, or a string that is encoded as a floating-point-number. Though if the VM interpreter is smart then it will make sure the encoding is compatible with the type Lyash type, and throw an error otherwise.

#### 7.4 Extension

This encoding already can represent over 17,000 words, which if they were all assigned would take 15bits, so it is a fairly efficient encoding. However the amount of words can be extended by increasing number of vowels, as well as tones. And it may even be possible to add an initial consonant if only one or two of the quote types is necessary. However this extension isn't likely to be necessary anytime in the near future, because adult vocabulary goes up to around 17,000 words, which includes a large number of synonyms. For instance the Lyash core words were generated by combining several different word-lists, which were all meant to be orthogonal, yet it turns out about half were internationally synonyms, so were cut down from around eight thousand to around four thousand words. It will be possible to flesh out the vocabulary with compound words and more technical words later on. Also it might make sense to supplant or remove some words like proper-names of countries.

Table 7.1: grammtical-case number system

## 7.8 Independent-Clause Code Name

Decided to make the independant-clause code name actually a universal hash, based on the sorts, cases, aspects and mood of the sentence. It's easier that way.

The grammatical cases can have a table to make it easy to identify them.

# Part III Machine Intelligence

# Machine Programmer

#### 8.1 Overview

A human programmer writes a function template, function suggestions and either provides a working function or sample input and output data.

An encoder encodes the function template and function suggestions into the intermediate representation (IR).

If the human programmer provides a working function, then the function profiler takes the function template IR and working function and generates the sample input and output data.

A population generator takes the function suggestions IR and input from  $\ensuremath{\text{dev/random}}$  to create the population IR.

The population compiler converts the population IR into kernel or ``.cl'' files, one for each.

The population tester loads each population kernel, and streams the sample inputs through them, checking outputs for correctness, and produces the population fitness which includes fitness of all individuals.

The champion selector takes the fitness ratings, and the population IR, and outputs the champions.

The population mutator and recombiner takes the champions and function suggestions, then generates a new population IR.

An output generator takes the champions and outputs the best ones to a file.
